DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Name of Title: Patient Health Records Portal Web Application

Abstract:

The Patient Health Records Portal Web Application is designed to make managing healthcare information simpler, faster, and more organized for patients. In many cases, individuals find it difficult to keep track of their medical records, test results, appointments, and billing details, which can lead to confusion and missed updates. This system brings all essential health-related information into one easy-to-use platform, helping patients access and manage their data efficiently while reducing manual effort and disorganization.

The portal allows users to easily view and manage their personal health information through a clear and structured interface. Patients can check their medical history, view test results, track upcoming appointments, and monitor billing details in one place. To make the system more useful and practical, features such as notifications for new reports or scheduled visits, basic messaging for communication, profile management, and downloadable records can be included. The system also provides a simple dashboard for quick updates and an organized layout that helps users find information without difficulty. In addition, an admin section is included to manage and organize the available data, ensuring smooth functioning of the application.

Finally, the proposed portal provides a complete and efficient solution for managing patient health information in a simple and organized way. It helps in maintaining all records in a centralized system while improving accessibility and clarity for users. The inclusion of a clean interface and well-structured modules makes it easier for patients to understand and manage their healthcare details effectively. Overall, this project aims to simplify healthcare information management by combining ease of use, organization, and accessibility, resulting in a better and more convenient experience for patients.
